

The perfect Dropper for oral applications

Easy and precise to use

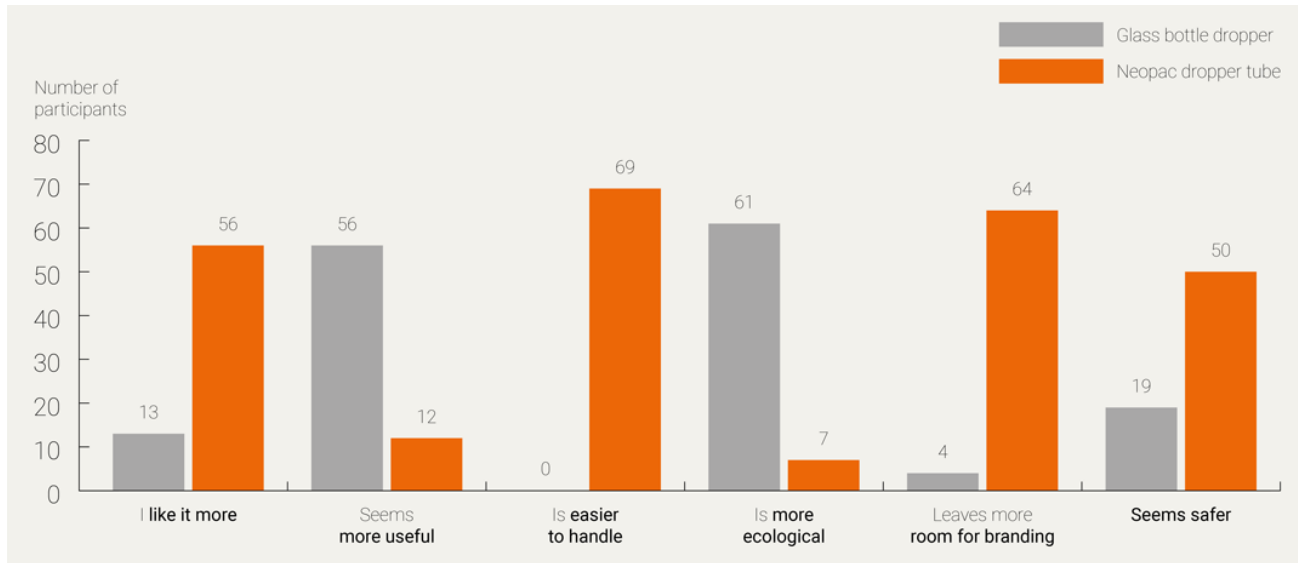

Pharmaceutical applications of drops for oral ingestion, such as vitamins and cough drops as well as liquid natural remedies, are usually packed in a glass bottle. Bottles are often tiresome for the user – "at first no drops appear, then too many appear and too fast" is a statement often heard from consumers.

With Neopac's dropper tube, you can offer your customers a user-friendly option, controlled drops and precise dosage. Your product therefore gains substantially more value.

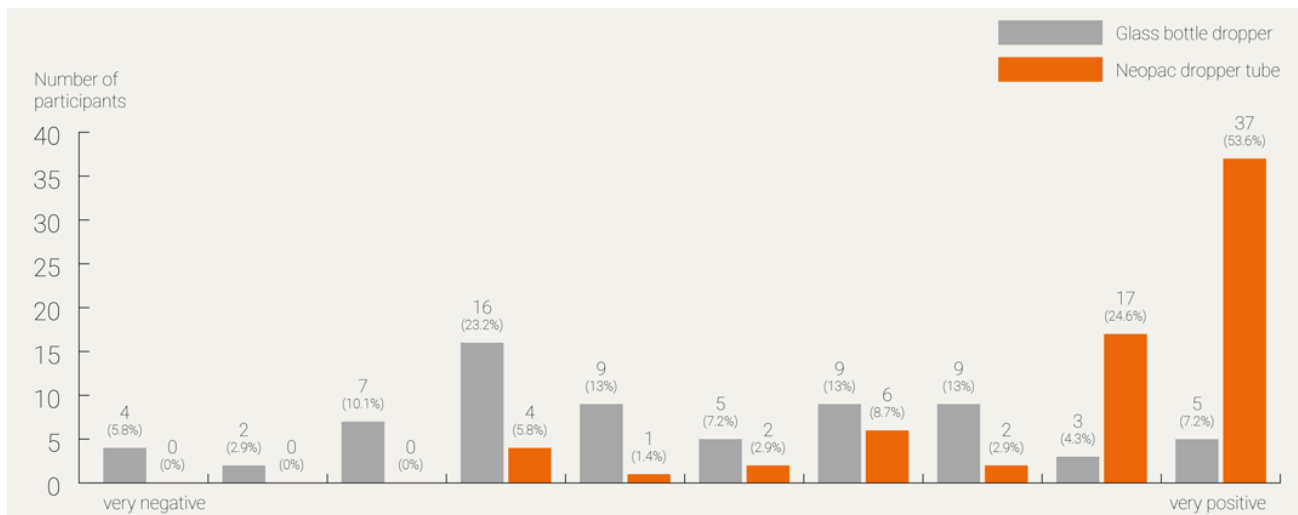

User approve dropper tubes in tests

As part of a user test at the Bern University of Applied Sciences, 69 participants evaluated the advantages and disadvantages of glass bottles versus dropper tubes respectively. Dropper tubes and child safety were examined. Here are the key findings from the survey.

Dropper tubes and glass bottles compared

How do you rate the dripping behaviour?

Advantages

- Ergonomic to use
- Easy and precise dosage
- Uniform drop formation
- Consistent amount of product released
- Individually adjustable dripping speed
- Different types of caps available: screw, wing or child-safe caps
- Variable and attractive printing
